

PREDICTING HOUSE PRICES WITH MACHINE LEARNING

EBUBECHUKWU OKONKWO

INTRODUCTION:

I've been working on an interesting machine learning project: predicting house prices using the Boston Housing Price Dataset! I used the XGBoost Regressor to build a model that can estimate prices based on features like crime rate, number of rooms, and property tax.

Here are a few key steps from my code:

- **Importing Libraries:** I started by importing essential libraries like NumPy, Pandas, and scikit-learn:

Python

```
import numpy as np
import pandas as pd
from sklearn.model_selection
import train_test_split
from xgboost import XGBRegressor
from sklearn import metrics
```

- **Loading the Dataset:** Then, I loaded the Boston Housing Price Dataset:

```
Python house_price_dataset =
sklearn.datasets.load_boston()
```

- **Creating a DataFrame:** I transformed the dataset into a Pandas DataFrame for easier manipulation:

Python

```
house_price_dataframe =
pd.DataFrame(house_price_dataset
.data, columns =
house_price_dataset.feature_name
s)
```

- **Model Training:** Finally, I trained the XGBoost Regressor model:

Python

```
model = XGBRegressor()
model.fit(x_train, y_train)
```

The model showed strong performance on the training data. I'm excited to continue refining it and exploring other datasets!
